GENERAL DESCRIPTION

The AS5C4009LL is organized as 524,288 x 8 SRAM utilizing a special ultra low power design process. ASI's pinout adheres to the JEDEC standard for pinout on 4 megabit SRAMs. The evolutionary 32 pin version allows for easy upgrades from the 1 meg SRAM design.

For flexibility in memory applications, ASI offers chip enable (CE\) and output enable (OE\) capabilities. These features can place the outputs in High-Z for additional flexibility in system design.

This devices operates from a single +5V power supply and all inputs and outputs are fully TTL-compatible.

Writing to these devices is accomplished when write enable (WE\) and CE\ inputs are both LOW. Reading is accomplished when WE\ remains HIGH and CE\ and OE\ go LOW. The device offers a reduced power standby mode when disabled, by lowering VCC to 2V and maintaining CE\ = 2V. This allows system designers to meet ultra low standby power requirements.

NOTES

1. Overshoot: $V_{CC} + 3.0V$ for pulse width $\leq 20ms$.
2. Undershoot: $-3V$ for pulse width $\leq 20ms$.
3. I_{CC} is dependent on output loading and cycle rates.
4. This parameter is guaranteed but not tested.
5. Test conditions as specified with the output loading as shown in Fig. 1 unless otherwise noted.
6. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , and t_{HZWE} is less than t_{LZWE} .
7. WE is HIGH for READ cycle.
8. Device is continuously selected. Chip enables and output enables are held in their active state.
9. Address valid prior to, or coincident with, latest occurring chip enable.
10. RC = Read Cycle Time.
11. Chip enable and write enable can initiate and terminate a WRITE cycle.
12. Output enable (OE) is inactive (HIGH).

14. ASI does not warrant functionality nor reliability of any product in which the junction temperature exceeds $150^{\circ}C$. Care should be taken to limit power to acceptable levels.
15. All voltage referenced to V_{SS} (GND).

- NOTES:**
1. t_{HZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels.
 2. At any given temperature and voltage condition, t_{HZ} (MAX) is less than t_{LZ} (MIN) both for a given device and from device to device interconnection.
 3. A write occurs during the overlap of a low CE\ and a low WE\ . A write begins at the latest transition among CE\ going Low and WE\ going Low: A write ends at the earliest transition among CE\ going High and WE\ going High, t_{WP} is measured from the beginning of write to the end of write.
 4. t_{CW} is measured from the CE\ going Low to end of write.
 5. t_{AS} is measured from the address valid to the beginning of write.
 6. t_{WR} is measured from the end of write to the address change. t_{WR} applied in case a write ends are CE\ or WE\ going High.
